Chapter 1

README

`band` is a c++ media-library.

Dependencies

- `libtool`: Combining static libraries when building.
- `doxygen`: Documentation generation.

Building

- `make` in the root-directory builds documentation.
- `make` in the 'band'-dierctory builds `band` into a static-library.
- `make` in the 'example'-directory builds all the examples. A `make clean` should be run before if the library itself was actually modified.

Running

- `cmd/file-to-code/file-to-code` runs a tool which generates a header and source file from a normal file.
- `example/bin/simple` runs the simple-example.

Linking

- Provide the path to the comailed 'band'-directory as an include-path and the compiled static-library as a linked-library. Additionally, `dl`, `X11`, and `pthread` should be linked. These aren't a dependency for all platforms so they are left to the consumer to link. An example can be seen in the 'Makefile' in the 'example' folder.

Feature-Requests

- Create a issue with the label 'enhancement'. It will be groomed then sorted into a release to be worked on.

Contributing

- Any task or feature-request can be worked on before being groomed on its own branch. If the feature is desired, it will be merged until a release.
